### Section 11 - Toxicological Information

#### Acute Dose Effects

**A: General Product Information**

Inhalation of metal fumes may cause metal fume fever, a flu-like illness generally lasting 24 hours or less.

- **Aluminum**: Chronic overexposure to aluminum can result in lung damage and has been associated with asthma-like syndrome. Accumulation of aluminum in the body may result in neurological damage, anemia and bone softening. Repeated overexposure to high levels of aluminum oxide may lead to pulmonary fibrosis, a progressive lung disorder.

- **Iron**: Chronic inhalation of iron has resulted in mottling of the lungs, a condition referred to as siderosis. This is considered benign pneumoconiosis and does not ordinarily cause significant physiologic impairment.

- **Silicon**: Silicon dust seems to have little adverse effect on lungs and does not appear to produce significant organic disease or toxic effects when exposures are kept under reasonable control. Silicosis may result from very high acute exposure or chronic exposure to silica dusts. The disease progresses through stages: cough, breathing difficulty, wheezing, recurrent chest diseases, decline of pulmonary function, fatigue and breathlessness (in later stages without exertion) and secondary heart damage.

- **Zinc**: Zinc poisoning can cause anemia, lethargy and dizziness. Inhalation of zinc fumes may cause metal fume fever, a flu-like illness generally lasting 24 hours or less.

- **Manganese**: Overexposure to manganese may result in CNS effects, anemia and pneumonitis which increased the risk of pneumonia.

**B: Component Analysis - LD50/LC50**

  Oral LD50 Rat: 984 mg/kg

  Oral LD50 Rat: 650 mg/kg

- **Zinc W (7440-66-6)**
  Oral LD50 Rat: >5000 mg/kg (related to Zinc oxide)

- **Bismuth P,W (7440-69-9)**
  Oral LD50 Rat: 5 g/kg
Repeated Dose Effects

Exposure to metal dusts and oxides may cause fume fever. Fume fever is a temporary flu-like condition characterized by chills, fever, muscle aches and pains, nausea and vomiting. Typically the symptoms appear within a few hours after exposure and subside within 2-3 days with no permanent effects.

Chronic inhalation of fumes may affect the digestive system, nervous system, respiratory system, muscles and joints.

Carcinogenicity

A: General Product Information

No carcinogenicity data available for this product. The State of California has listed lead as a suspect carcinogen (Proposition 65). Inorganic lead has been found to have toxic effects on both the central and peripheral nervous systems. Symptoms of lead toxicity include behavioral disturbances such as irritability, restlessness, insomnia, and other sleep disturbances, fatigue, vertigo, headache, poor memory, tremor, depression, and apathy. With more severe exposure, symptoms can progress to drowsiness, stupor, hallucinations, delirium, convulsions, and coma.
